Product re-ordering process enhanced

ERIKS Easy Order System helped beverage customer to optimise their stores

ISSUE

Leading beverage manufacturer Heineken, approached their local ERIKS Service Centre requesting assistance and advice regarding the way their stores are stocked and replenished.

They were looking for a solution that would make items far easier to locate and the re-ordering of those products far more effective than their existing process.

SOLUTION

To assist the customer in solving this issue, their local Service Centre sourced and fitted a number of ERIKS storage bins with location templates to help find products with greater ease.

The ERIKS E-Business team then got involved and assisted in the creation and implementation of barcode labels and a scanner for the Service Centre to use.

The Service Centre now go into Heineken on a weekly basis and scan any items that are identified for replenishment. The order is then passed into the ERIKS Easy Order System that sends an electronic order into the ERIKS stock system for sourcing. The goods arrive and are placed into the relevant bin locations at Heineken.

OTHER BENEFITS

- Reduced purchase orders raised
- Increased time efficiency

FURTHER COMMENTS...

"I was very impressed with the installation of the ERIKS vendor managed inventory system in our workshop. The system has run smoothly since it was set up a year ago, and the set up looks very professional. It has helped to reduce the number of purchase orders we need to raise, and has saved a considerable amount of engineering time by ensuring continual access to consumable items and critical fittings".
